Specially trained nurses and pharmacists are available to help, 24 hours a day.

Talk to your doctor, pharmacist, or call the Carolinas Poison Center at 1-800-222-1222.

### **Questions?**

• Many prescription pain medications and natural products, cough suppressants, sinus/allergy, and stomach medicines contain the same or similar ingredients found in OTC products. Ask your doctor or pharmacist if there are OTC products you should not take while taking prescription medication.

• Most medicines and supplements can cause minor adverse effects. Some should not be taken by people with certain medical conditions. Never take more than the dose recommended on the package.

# Open for a list of important drug interactions.

• Just because a product is "over-the-counter" or "natural" does not mean it is totally safe. Follow package instructions and warnings carefully.

• Tell your doctor and pharmacist about any over-the-counter (OTC), herbal, natural, or homeopathic products or nutritional supplements you are taking. These can interact with your medicines.

These symptoms may be caused by a medicine. More importantly, doses of your medicines may have to be changed if you have lost weight or become dehydrated. An example of this is metformin (Glucophage<sup>TM</sup>).

 Notify your doctor for recent or sudden weight loss or a lengthy period of vomiting or diarrhea.

• Take all medications with at least several swallows of water and stand or sit upright if possible. This will help move medicines to the stomach, and decrease throat irritation from the medicines.

1-800-222-1222

If you have questions about your medicines,

talk to your doctor or call

Carolinas Poison Center at 1-800-222-1222.

We can help if you've missed a dose,

accidentally taken too much,

or have questions about interactions with your medicine.

How can I prevent problems with my medications?

A drug interaction happens when one drug changes how another drug behaves in the body causing increased or decreased effects of at least one of the drugs.

An adverse drug reaction is an unwanted effect caused by a medicine, such as nausea or a bad taste in your mouth. Most reactions are minor, but some can be serious. Some drugs affect seniors more than younger people.

Adverse reactions to medicines and interactions of medicines can be serious and lead to hospital admissions. Being well-informed about your medicines can prevent many of these reactions.

## Important Supplement -Drug Interactions

If you are taking:

Talk to your Doctor if you are also taking:

Garlic powder Saquinavir (Fortovase®)

\* Decreased antiviral actions of saquinivir

\_\_\_\_\_\_

Diltiazem (Cardizem®) Nifedipine (Procardia®)

Decreased blood pressure and heart rate

Gingko biloba

Gingko biloba

Warfarin (Coumadin®)

\* Increased risk of bleeding

Quinine

Carbamazepine

(Tegretol®)

\* Carbamazepine toxicity: drowsiness, slurred speech

St. John's Wort

St. John's Wort

Digoxin (Lanoxin®)

\* Decreased effects of digoxin on the heart

an on the neart

\* Decreased effects of nifedipine on the heart

St. John's Wort

Simvastatin (Zocor®)

Nifedipine (Procardia®)

Vytorin®)

\* Decreased effects of simvastatin on cholesterol

St. John's Wort

Warfarin (Coumadin®)

\* Decreased effects of warfarin

Vitimin E

Warfarin (Coumadin®)

\* Increased risk of bleeding
