What is Gynecological Cancer?

Gynecological cancer is a cancer that occurs in the female reproductive organs.

The Five Main Types

- Cervical
- Ovarian
- Uterine
- Vaginal
- Vulvar

HPV

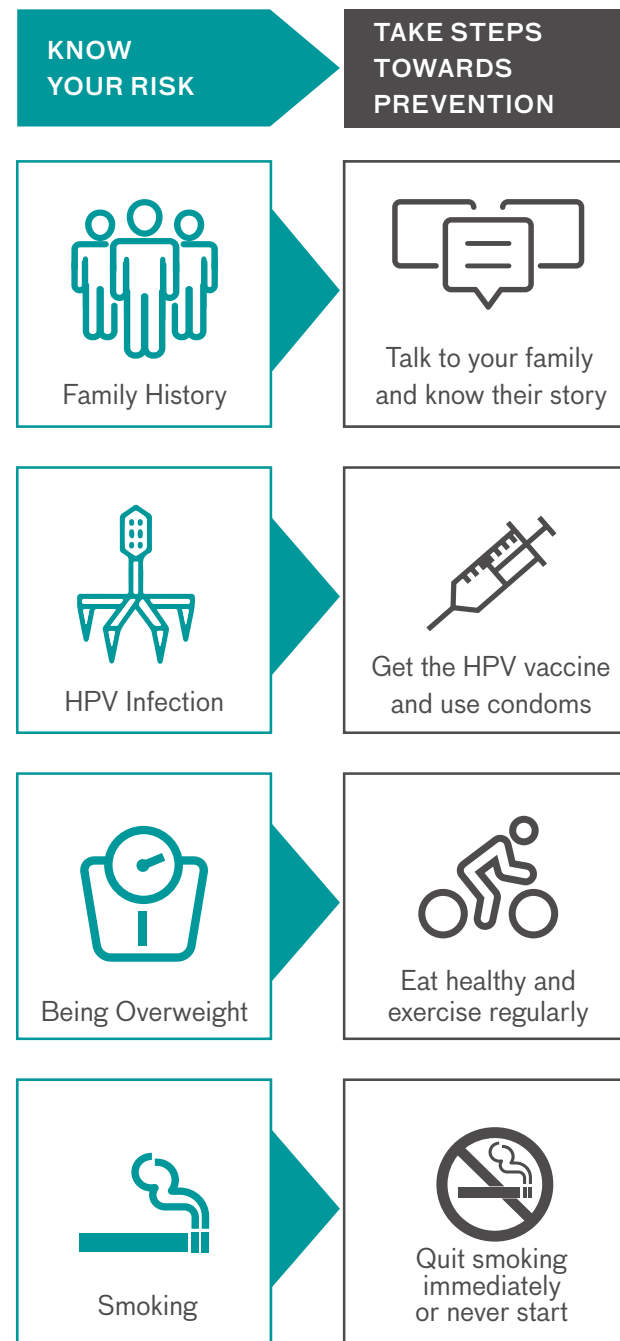

Human papillomavirus (HPV) is a common virus that is spread through sexual contact.

There are several types of HPV. Many types do not cause problems. Some types of HPV can lead to cervical, vaginal and vulvar cancer.

It is recommended that boys and girls get the vaccine between the ages of 9 and 12. The vaccine can be administered through age 26.

What Can I Do?

Screening

- The Pap test can be used to find cervical cancer early and any changes in the cervix that can lead to cancer. The test checks cells taken from the opening of the cervix under a microscope.
- No other gynecological cancer has a simple and reliable screening test, which is why it is important to be aware of symptoms.
- Know your body and watch for any changes.
- See your doctor regularly to catch any changes early.

If symptoms last longer than two weeks, talk to a medical professional.

SYMPTOM	TYPE OF CANCER				
	CERVICAL	OVARIAN	UTERINE	VAGINAL	VULVAR
Vaginal bleeding or discharge that is abnormal	Blue	Red	Orange	Light Blue	White
Pain or pressure in the pelvis	White	Red	Orange	White	Dark Grey
